Disclaimer

Highmark WholecareSM medical policy is intended to serve only as a general reference resource regarding coverage for the services described. This policy does not constitute medical advice and is not intended to govern or otherwise influence medical decisions.

Policy Statement

Highmark WholecareSM may provide coverage under the medical-surgical benefits of the Company's Medicaid products for medically necessary intraoperative neurophysiologic monitoring.

This policy is designed to address medical necessity guidelines that are appropriate for the majority of individuals with a particular disease, illness or condition. Each person's unique clinical circumstances warrant individual consideration, based upon review of applicable medical records.

(Current applicable Pennsylvania HealthChoices Agreement Section V. Program Requirements, B. Prior Authorization of Services, 1. General Prior Authorization Requirements.)

Definitions

Prior Authorization Review Panel (PARP) – A panel of representatives from within the PA Department of Human Services who have been assigned organizational responsibility for the review, approval and denial of all PH-MCO Prior Authorization policies and procedures.

Intraoperative neurophysiologic monitoring (IONM) - describes a variety of procedures that have been used to monitor the integrity of neural pathways during high-risk neurosurgical, orthopedic, and vascular surgeries. Involves continuous evaluation of the electrical activity of one or more neural pathways in an anesthetized patient. The goal of these monitoring modalities is to detect surgical or physiological insults to the nervous system while they are still reversible, or in cases where prevention is not an option, to minimize the damage done to these structures during surgical resection.

Procedures

1. IONM, which may include somatosensory-evoked potentials, motor-evoked potentials using transcranial electrical stimulation, brainstem auditory-evoked potentials, electromyography (EMG) of cranial nerves, electroencephalogram (EEG), or electrocorticography (ECoG), may be considered medically necessary when ALL of the following criteria are met:
 - A. The procedure is performed by an operator who is certified by the American Board of Medical Specialties (ABMS); AND
 - B. When the procedure is used to monitor only one (1) procedure at a time; AND
 - C. For individuals undergoing ANY of the following procedures:
 - Aortic arch, its branch vessels, or thoracic aorta surgery, including carotid artery surgery, when there is a risk of cerebral or spinal cord ischemia
 - Aortic procedures, distal, where there is risk of ischemia to spinal cord
 - Arteriovenous malformations (AVMs), surgery or embolization for intracranial AVMs
 - Basal ganglia movement disorders
 - Deep brain stimulations
 - Brain, resection of epileptogenic tissue or tumor
 - Brain, resection of tissue close to the eloquent brain cortex and requiring brain mapping
 - Brain surgery as a result of traumatic injury
 - Bronchial artery arteriovenous malformations or tumors, embolization of
 - Carotid artery arteriography, during which there is a test occlusion of the carotid artery
 - Cerebral vascular aneurysms
 - Circulatory arrest with hypothermia (does not include surgeries performed under circulatory bypass (e.g., coronary artery bypass grafting [CABG], ventricular aneurysms)
 - Cranial nerve protection during ANY of the following:
 - Resection of tumors involving the cranial nerves
 - Cavernous sinus tumors
 - Microvascular decompression of cranial nerves
 - Skull base surgery in the vicinity of the cranial nerves and surgeries of the foramen magnum
 - Oval or round window graft

- Endolymphatic shunt for Meniere’s disease
 - Leg lengthening procedures, where there is traction on sciatic nerve or other nerve trunks
 - Movement disorders, surgery for intractable movement disorders
 - Peripheral nerves, neuromas of the brachial plexus, where there is risk to major sensory or motor nerves
 - Responsive neurostimulation for epilepsy
 - Spinal cord, arteriovenous malformation surgery
 - Spinal cord, correction of scoliosis or deformity of the spinal cord involving fraction of the cord
 - Spinal cord, decompressive procedures on the spinal cord or cauda equina carried out for myelopathy or claudication where function of spinal cord or spinal nerves is at risk
 - Spinal cord, protection where work is performed in proximity to cord and nerve roots as in the placement of new instrumentation, removal of old hardware, or where there have been numerous interventions
 - Spinal cord surgery as a result of a traumatic injury
 - Spinal cord tumors and spinal fractures (with the risk of cord compression)
 - Spinal instrumentation requiring pedicle screws, disc arthroplasty, or distraction
 - Vestibular section for vertigo
2. IONM of the recurrent laryngeal nerve may be considered medically necessary in individuals undergoing ANY of the following:
- A. Anterior cervical spine surgery associated with ANY of the following increased risk situations:
 - 1) Multilevel anterior cervical discectomy and fusion; OR
 - 2) Preexisting recurrent laryngeal nerve pathology, when there is residual function of the recurrent laryngeal nerve; OR
 - 3) Prior anterior cervical surgery, particularly revision anterior cervical discectomy and fusion, revision surgery through a scarred surgical field, reoperation for pseudarthrosis, or revision for failed fusion; OR
 - B. High-risk thyroid or parathyroid surgery, including ANY of the following:
 - 1) Repeat thyroid or parathyroid surgery; OR
 - 2) Retrosternal or giant goiter; OR
 - 3) Surgery for cancer; OR
 - 4) Thyrotoxicosis; OR
 - 5) Thyroiditis; OR
 - 6) Total thyroidectomy.
3. When IONM services are not considered medically necessary:
- IONM not meeting the criteria as indicated in this policy is considered not medically necessary.
 - IONM performed for more than one (1) procedure at a time is considered not medically necessary.
 - IONM of the recurrent laryngeal nerve not meeting the criteria as indicated in this policy is considered experimental/investigational and therefore, not medically necessary because the safety and/or effectiveness of this service cannot be established by the available peer-reviewed literature.
 - IONM of visual-evoked potentials (VEPs) is considered experimental/investigational and therefore, not medically necessary because the safety and/or effectiveness of this service cannot be established by the available peer-reviewed literature.

4. Post-payment Audit Statement

The medical record must include documentation that reflects the medical necessity criteria and is subject to audit by Highmark WholecareSM at any time pursuant to the terms of your provider agreement.

5. Place of Service

The proper place of service for IONM is outpatient.

Summary of Literature

Intraoperative neurophysiological monitoring (IONM) is the use of physiological monitoring techniques to assess neural integrity and/or to map or neuro-navigate within at-risk neural structures during various surgical procedures. The delivery of IONM services should be provided by an Intraoperative neurophysiological monitoring supervising professional (IONM-P). IONM patient care by the IONM-P includes evaluation of patient factors for IONM planning, intraoperative care including waveform interpretation, postoperative follow-up (as indicated), and the management of personnel who operate the instrumentation supporting these activities (Gertsch, et al., 2019).

A pre-IONM evaluation of patient information permits for the development of a patient-specific IONM care plan that considers pre-operative data points that may influence results, interpretation, and reliability of IONM. The evaluation may include, for example, a review of the medical record for prior imaging and/or neurophysiological procedure results, history-taking, and a focused examination. The pre-IONM evaluation may also provide the patient with a description of any IONM procedures along with the risks, and allow for informed decision-making on the part of the patient (Gertsch, et al., 2019).

To optimize patient care and safety, the IONM-P should remain continuously available perform intraoperative responsibilities in real time throughout the procedure. The IONM-P:

- Supervises all technical aspects of the IONM to ensure overall patient safety and quality of care.
- Communicates and collaborates with other members of the patient care team.
- Interprets IONM data:
 - Evaluates the quality and consistency of baseline data and identifies abnormalities in the context of known variables.

- Evaluates IONM data in the context of the procedure and takes into account patient vitals, imaging, and labs when available and appropriate.
- Evaluates and interprets data obtained from topographical/neuro-navigation studies.
- Develops a differential diagnosis:
 - Determines the significance of changes from baseline data. If possible, determines if changes are related to iatrogenic injury, anesthetic effects, physiological variables, patient positioning, technical factors, or a combination of these.
 - Recommends assessment technique(s) most appropriate to answer anatomic, functional, or prognostic questions related to specific neural structures.
- Provides input to the patient care team to help develop and execute a plan of therapeutic intervention to recover neural function when an adverse alteration in IONM data presents (Gertsch, et al., 2019)

The IONM post-operative report should include:

- The patient, surgeon, and IONM care team identified
- The surgical procedure(s) performed
- The types of modalities recorded with a description of the baseline responses
- Neural topographical/neuro-navigational data acquired (when applicable)
- Details of any significant changes in responses during the procedures
- Interventional measures recommended (in the case of concern for injury)
- Final responses obtained
- Details of post-operative neurological status when possible and relevant (Gertsch, et al., 2019)

IONM during spinal surgery has used to reduce the incidence of postoperative neurological complications, including level of the spinal cord, cauda equina and nerve root. Several established technologies are available and combined motor and somatosensory evoked potentials are considered mandatory for practical and successful IONM. Currently, the most commonly employed IONM techniques for spinal procedures include (1) somatosensory sensory evoked potentials (SSEPs), (2) motor-evoked potentials (MEPs), and (3) spontaneous and triggered electromyography (EMG) (Park & Hyun, 2015).

SSEPs assess the functional integrity of sensory pathways from the peripheral nerve through the dorsal column and to the sensory cortex. MEPs consist of spinal, neurogenic and muscle MEPs. MEPs allow selective and specific assessment of the functional integrity of descending motor pathways, from the motor cortex to peripheral muscles. Spinal surgeons should understand the concept of the monitoring techniques and interpret monitoring records adequately to use IOM for the decision making during the surgery for safe surgery and a favorable surgical outcome (Park & Hyun, 2015).

EMG, which comes in the form of spontaneous (sEMG) or triggered (tEMG), is a tool used for neuromonitoring specific nerve roots at risk of injury during spinal instrumentation. Similar to SSEPs, sEMG is recorded continuously, thus giving the advantage of real-time feedback throughout the entire procedure. However, in order to have a proper sEMG response, neuromuscular blockade is prohibited. On the other hand, tEMGs are obtained by stimulating the center of the tulip of the pedicle screw. The response is then recorded from the appropriate muscle group (Charalampidis, et al., 2020).

EEG

An electroencephalogram (EEG) measures the activity of the cerebral cortical neuron via the scalp electrode. Each scalp electrode collects around 6 cm² synchronous cortical activity. This electrical activity is the summation of the postsynaptic potentials (inhibitory and excitatory) from pyramidal cells near each

recording electrode.[6] Invasive EEG (iEEG) is recorded with subdural grid electrodes, depth electrodes, or epidural peg electrodes. Subdural electrodes are implanted subdurally over the brain surface. Depth electrodes are placed in deep structures like the hippocampus, amygdala, insula, or lesions under neuronavigation guidance. Epidural peg electrodes are placed by creating a trephination of the skull and inserting the electrode with the tip touching the dura.

ECoG

For epilepsy patient is unresponsive to medications, there may be alternative, surgical treatments that may be an option. To determine this, the treating neurologist may obtain magnetic resonance imaging (MRI) and electroencephalography (EEG) over prolonged periods of time to determine where the seizures are coming from in the brain. In cases where the precise area where the seizures are coming from cannot be determined, patients may undergo a procedure so that more precise EEG information can be obtained. These invasive leads are used to perform electrocorticography (ECoG). The leads that detect the seizures may be paddles that face on the brain or cylindrical leads that go into the brain. Sometimes a combination of both are used. The procedures are often called subdural grid placement, depth electrode placement or stereoelectroencephalography (sEEG) (AANS, 2023).

VEP

In neurosurgical procedures that may cause visual impairment in the intraoperative period, the monitoring of flash visual evoked potential (VEP) (also known as visual evoked cortical potentials [VECPs] or visual evoked responses [VERs]), is clinically used to evaluate visual function. Patients are unconscious during surgery under general anesthesia, making flash VEP monitoring useful as it can objectively evaluate visual function (Hayashi & Kawaguchi, 2017). For many years, visual electrophysiology laboratories around the world recorded VEPs using different techniques. Consequently, there were many divergent opinions concerning the neurophysiological basis of the components of the responses, the clinical usefulness of the technique, and the abnormalities associated with specific diseases (AAO, 2015).

The overall risk of IONM is low. Electrical safety is paramount in the operating room. Patients under anesthesia cannot report discomfort or pain; so, it is vital to ensure that IONM equipment is checked before a safe operation. Monitoring equipment malfunctioning can lead to local skin burns and other serious complications. An additional reported risk is seizure activity, high frequency (50 to 60 Hz) electrical brain stimulation can lead to seizure activity due to abnormal neuronal discharges. There are no absolute contraindication for any of the techniques of IONM. Relative contraindications for motor evoked potentials are the presence of vascular clips, intracranial electrodes, pacemakers, other implanted bio-mechanical equipment, cortical lesions, skull defects, increased intracranial pressure, and history of epilepsy. According to the guideline of the American Clinical Neurophysiology Society (ACNS), transcranial MEPs can induce seizures. The incidence is very low, so the history of epilepsy is not considered a contraindication to MEP monitoring. (Ghatol & Widrich, 2023).

Procedure Codes

CPT/HCPCS Code	Description
92650	Auditory evoked potentials; screening of auditory potential with broadband stimuli, automated analysis
92651	Auditory evoked potentials; for hearing status determination, broadband stimuli, with interpretation and report
92652	Auditory evoked potentials; for threshold estimation at multiple frequencies, with interpretation and report
92653	Auditory evoked potentials; neurodiagnostic, with interpretation and report
95829	Electrocorticogram at surgery (separate procedure)
95860	Needle electromyography; 1 extremity with or without related paraspinal areas
95861	Needle electromyography; 2 extremities with or without related paraspinal areas
95863	Needle electromyography; 3 extremities with or without related paraspinal areas
95864	Needle electromyography; 4 extremities with or without related paraspinal areas
95865	Needle electromyography; larynx
95867	Needle electromyography; cranial nerve supplied muscle(s), unilateral
95868	Needle electromyography; cranial nerve supplied muscles, bilateral
95907	Nerve conduction studies; 1-2 studies
95908	Nerve conduction studies; 3-4 studies
95909	Nerve conduction studies; 5-6 studies
95910	Nerve conduction studies; 7-8 studies
95911	Nerve conduction studies; 9-10 studies
95912	Nerve conduction studies; 11-12 studies
95913	Nerve conduction studies; 13 or more studies
95925	Short-latency somatosensory evoked potential study, stimulation of any/all peripheral nerves or skin sites, recording from the central nervous system; in upper limbs
95926	Short-latency somatosensory evoked potential study, stimulation of any/all peripheral nerves or skin sites, recording from the central nervous system; in lower limbs
95927	Short-latency somatosensory evoked potential study, stimulation of any/all peripheral nerves or skin sites, recording from the central nervous system; in the trunk or head
95928	Central motor evoked potential study (transcranial motor stimulation); upper limbs
95929	Central motor evoked potential study (transcranial motor stimulation); lower limbs
95937	Neuromuscular junction testing (repetitive stimulation, paired stimuli), each nerve, any 1 method
95938	Short-latency somatosensory evoked potential study, stimulation of any/all peripheral nerves or skin sites, recording from the central nervous system; in upper and lower limbs
95939	Central motor evoked potential study (transcranial motor stimulation); in upper and lower limbs
95940	Continuous intraoperative neurophysiology monitoring in the operating room, one on one monitoring requiring personal attendance, each 15 minutes (List separately in addition to code for primary procedure)
95955	Electroencephalogram (EEG) during nonintracranial surgery (eg, carotid surgery)

G0453	Continuous intraoperative neurophysiology monitoring, from outside the operating room (remote or nearby), per patient, (attention directed exclusively to one patient) each 15 minutes (list in addition to primary procedure)
